

# Mizaan Work Log

Running human-readable implementation log for local Mizaan work sessions.

## 2026-05-29 07:20 AM +08:00 ? Phase 4 Page Workspace Foundation

### Summary

Phase 4 implemented a provider-backed Notion-like page workspace foundation with breadcrumbs, page header, editable title, editable blocks, properties, relation/backlink/outgoing context, subpages, templates, and right-panel tabs.

The session also repaired prerequisite VaultProvider and vault lifecycle gaps while preserving the active browser localStorage prototype boundary. No SQLite, Tauri, portable folder vault, lock file, cloud, Google, auth, backend, or sync behavior was added.

### Files Changed

- Vault provider and lifecycle: src/lib/vault/types.ts, local-storage-vault-provider.ts, use-vault.ts, vault-session.ts, local-items.ts.
- Page model and tests: src/lib/page/page-workspace.ts and page-workspace.test.ts.
- Page UI: src/components/page/PageWorkspace.tsx, PageHeader.tsx, PageBreadcrumbs.tsx, PageProperties.tsx, PageEditorSurface.tsx, PageRightPanel.tsx, PageLinkedContext.tsx, PageSubpages.tsx.
- Routes and shell: src/routes/page.\$id.tsx, notes/documents/projects/people/finance/calendar/trackers/templates routes, vault.tsx, settings.tsx, graph.tsx, trash.tsx, index.tsx, \_\_root.tsx, AppSidebar.tsx, TopBar.tsx, CommandPalette.tsx.
- QA and docs: scripts/phase4-browser-qa.mjs, Phase 4 report, Phase 5 blueprint, implementation tracker, self-closer, and screenshots.

### Function Changes

| Function         | File                       | Before                                                                            | After                                                                                                                               |
|------------------|----------------------------|-----------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------|
| useVaultSnapshot | src/lib/vault/use-vault.ts | Returned provider data directly during render, which could diverge between server | Returns a stable hydration snapshot first, then loads the browser provider snapshot after mount and subscribes to provider changes. |

|                            |                                           |                                                                                                               |                                                                                                                                                                                                      |
|----------------------------|-------------------------------------------|---------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                            |                                           | memory state and browser localStorage.                                                                        |                                                                                                                                                                                                      |
| buildPageWorkspaceModel    | src/lib/page/page-workspace.ts            | Read provider snapshot directly inside the model builder and used the provider again to decide missing state. | Accepts a snapshot, normalizes item/block/relation context from that snapshot, builds breadcrumbs, child pages, relation backlinks, outgoing links, properties, and missing state deterministically. |
| createPageFromTemplate     | src/lib/page/page-workspace.ts            | Template cards were not guaranteed to create real provider-backed pages.                                      | Creates a real item, writes starter blocks through the provider, and opens the page workspace.                                                                                                       |
| createChildPage            | src/lib/page/page-workspace.ts            | Nested page behavior was mock/static or absent.                                                               | Creates a real provider item with parentId, starter block, and parent-child relation.                                                                                                                |
| PageEditorSurface.addBlock | src/components/page/PageEditorSurface.tsx | Block insertion was visual-only in the old editor surface.                                                    | Creates provider-backed blocks, supports Enter-to-add, to-do checked state, and slash command insertion for implemented block types.                                                                 |

|                        |                                   |                                                                   |                                                                                                        |
|------------------------|-----------------------------------|-------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------|
| CommandPalette actions | src/components/CommandPalette.tsx | Palette actions could expose non-working or mock-driven behavior. | Actions now create/open real provider pages and navigate to working Vault, Settings, and Graph routes. |
|------------------------|-----------------------------------|-------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------|

## Spaghetti Cleanup Notes

- Replaced mock-only item lists with provider-backed item/block/relation reads. (spaghetti code cleared)
- Centralized page workspace model normalization, template creation, breadcrumbs, and relation context in src/lib/page/page-workspace.ts. (spaghetti code cleared)
- Removed obsolete mock editor/right-panel surfaces after the page workspace owned those responsibilities. (spaghetti code cleared)
- Fixed render-time provider reads that caused server/client hydration divergence. (spaghetti code cleared)

## Screenshots

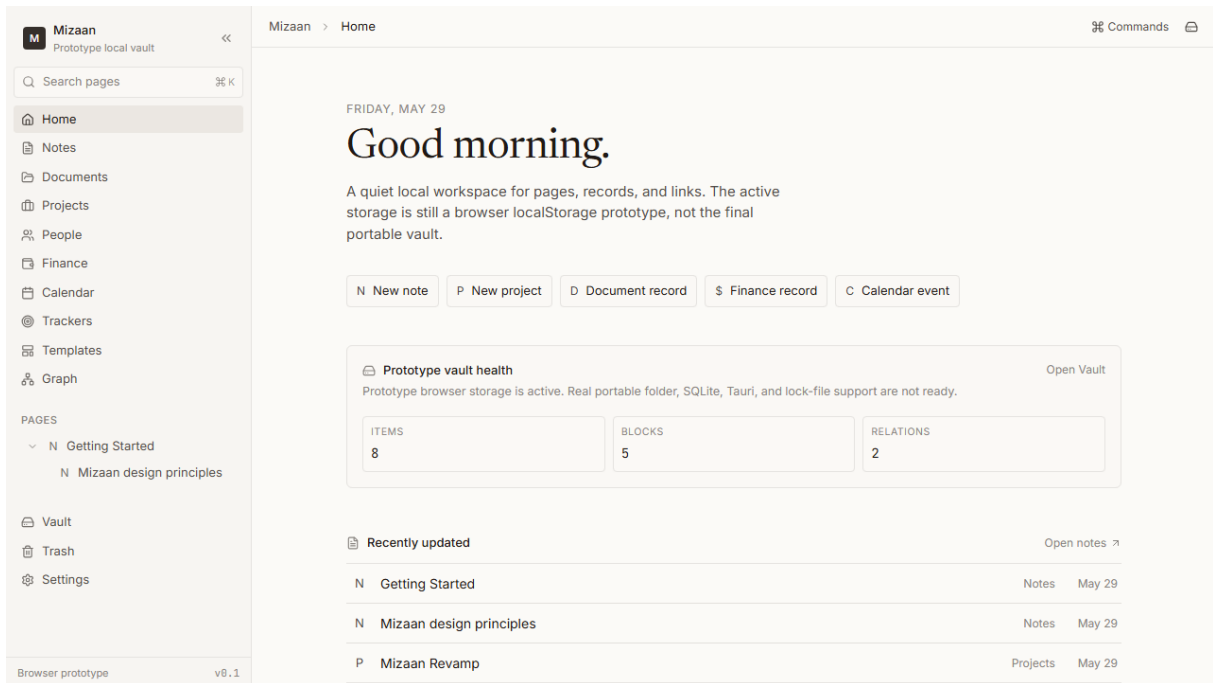

### Home route after Phase 4

Screenshot filename: 20260529-0705-phase-4-home.png

Date/time: 2026-05-29 07:05 AM +08:00

Shows the provider-backed home surface, prototype vault health, recent pages, and local quick actions.

Route/page shown: Home route after Phase 4

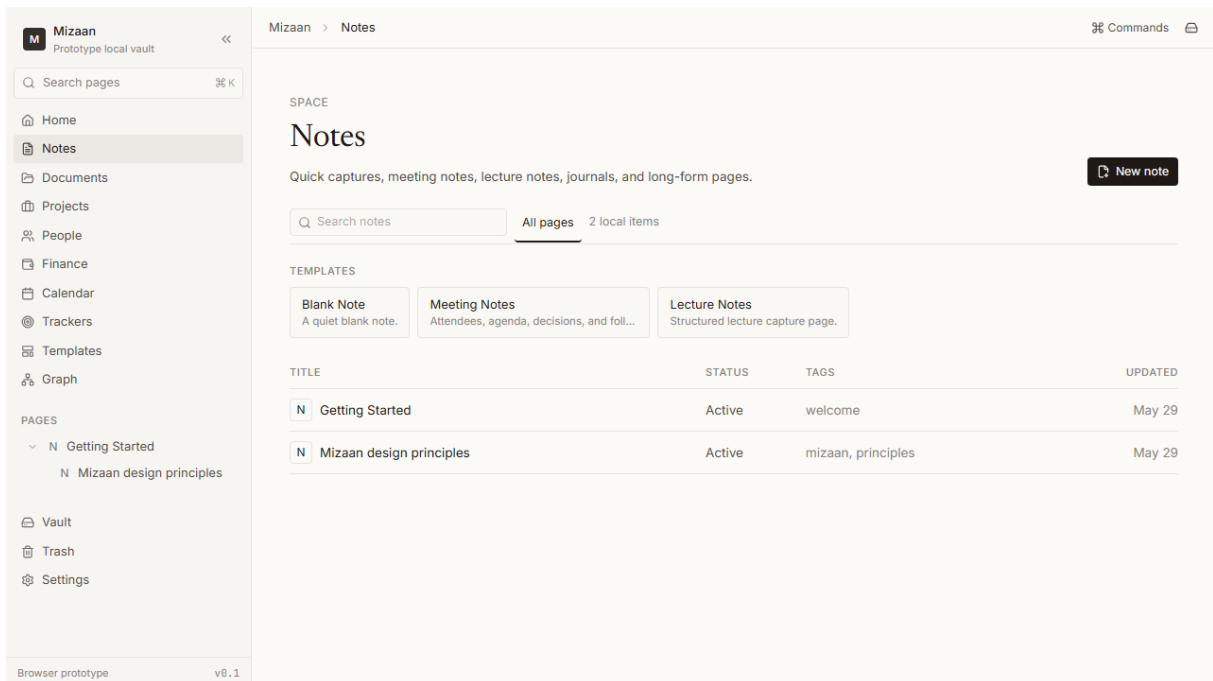

## Notes space / page list

Screenshot filename: 20260529-0705-phase-4-notes-space.png

Date/time: 2026-05-29 07:05 AM +08:00

Shows the provider-backed Notes list and template actions before opening the page workspace.

Route/page shown: Notes space / page list

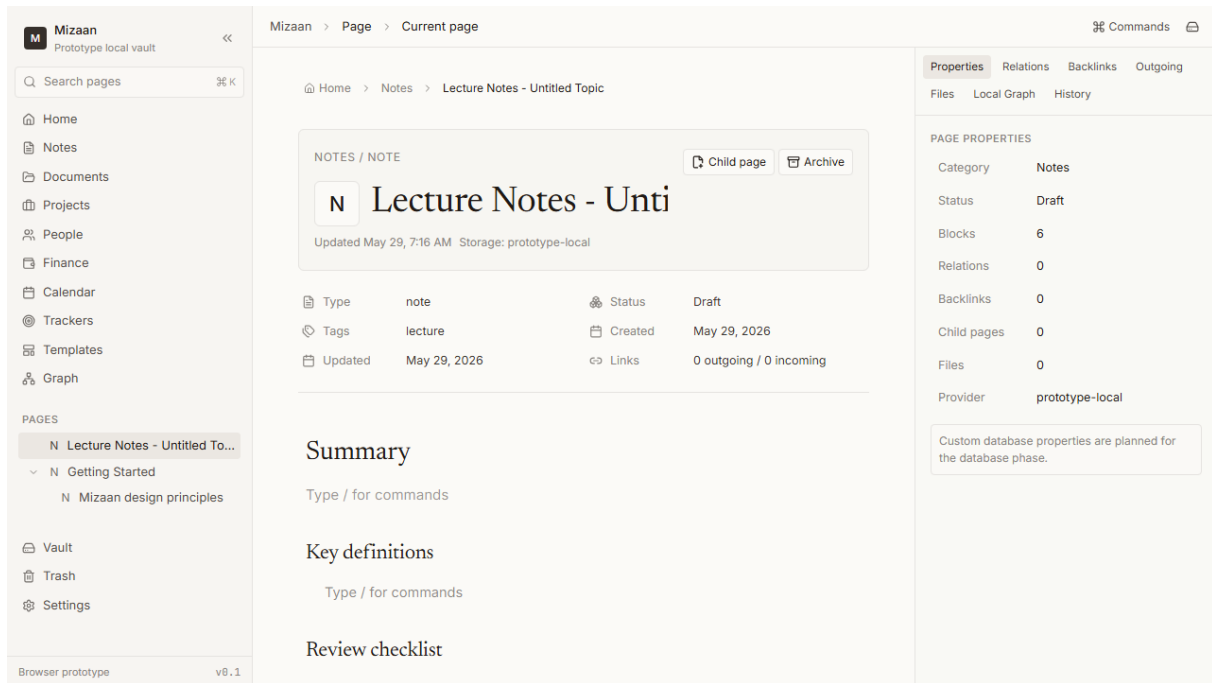

## Page workspace

Screenshot filename: 20260529-0705-phase-4-page-workspace.png

Date/time: 2026-05-29 07:05 AM +08:00

Shows breadcrumbs, page header, editable title, properties, block editor, and the right panel foundation.

Route/page shown: Page workspace

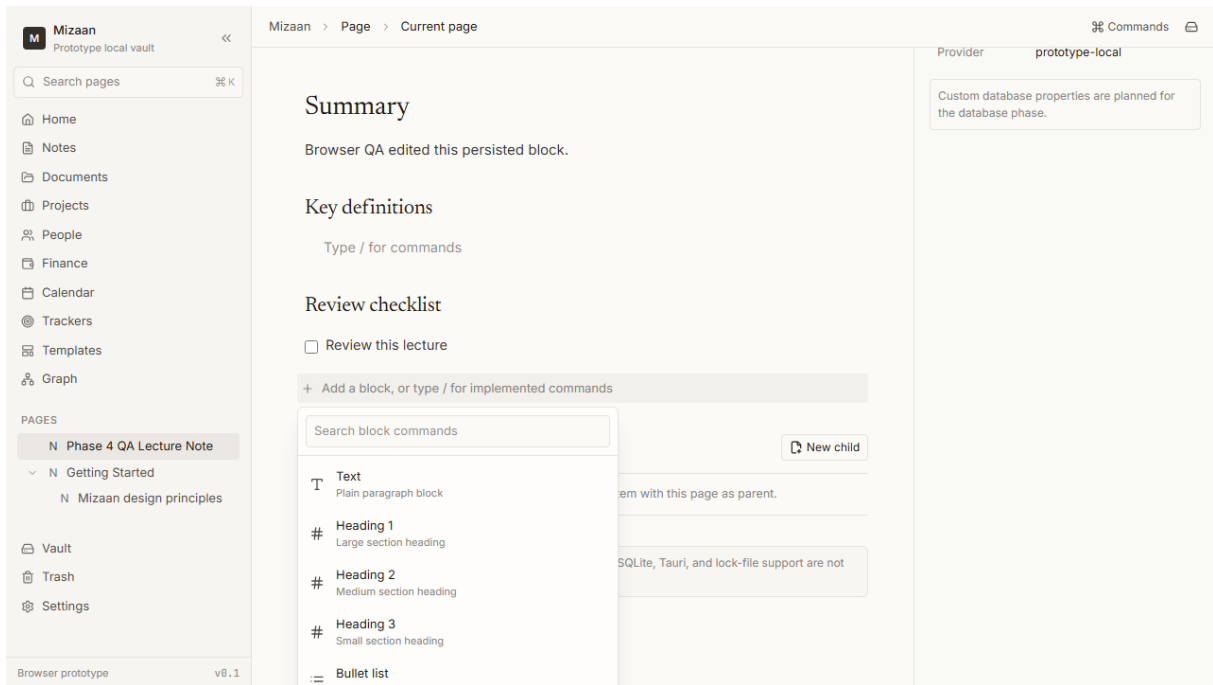

## Slash command menu

Screenshot filename: 20260529-0705-phase-4-slash-menu.png

Date/time: 2026-05-29 07:05 AM +08:00

Shows the implemented block command menu used during browser QA.

Route/page shown: Slash command menu

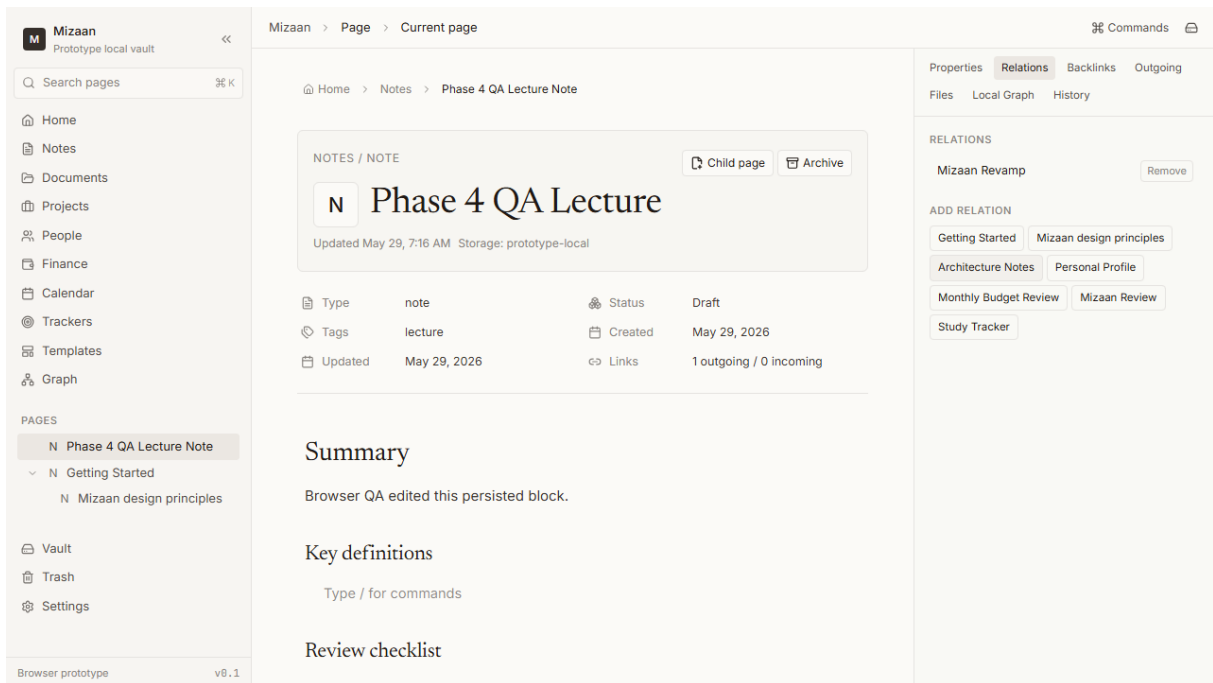

## Right panel relations

Screenshot filename: 20260529-0705-phase-4-page-right-panel-relations.png

Date/time: 2026-05-29 07:05 AM +08:00

Shows relation controls and relation-based context in the page right panel.

Route/page shown: Right panel relations

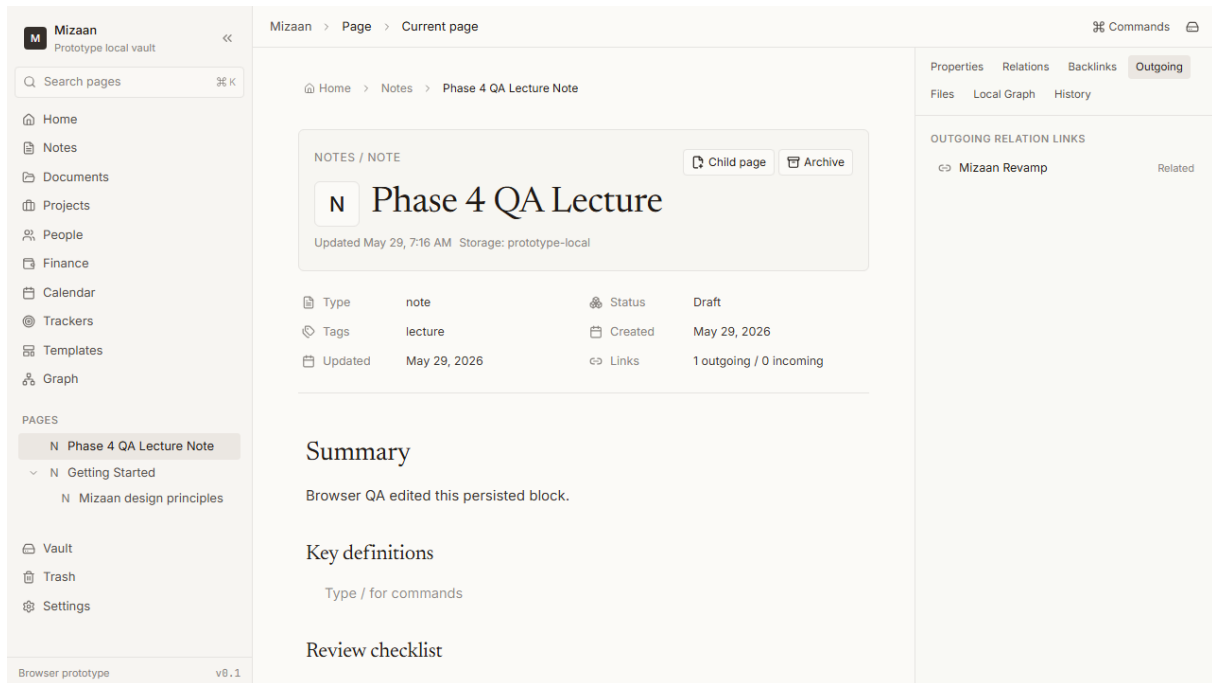

## Outgoing relation context

Screenshot filename: 20260529-0705-phase-4-relation-outgoing-section.png

Date/time: 2026-05-29 07:05 AM +08:00

Shows the outgoing links tab using real relation records rather than fake backlinks.

Route/page shown: Outgoing relation context

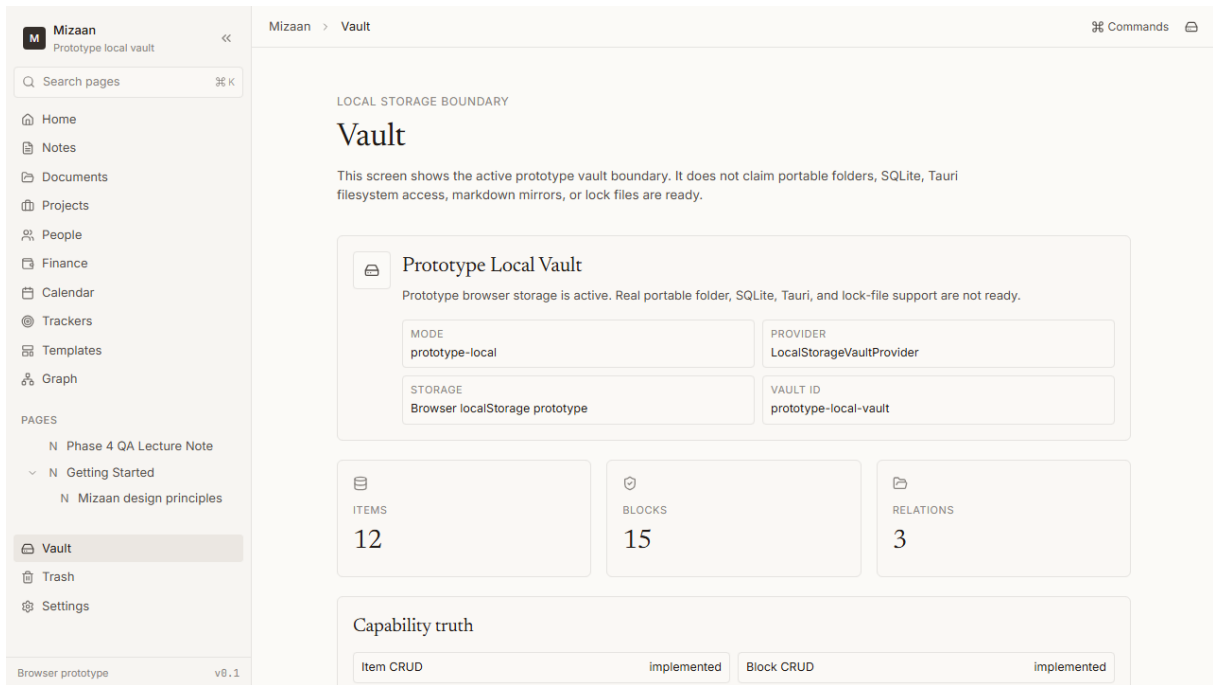

## Vault still working

Screenshot filename: 20260529-0705-phase-4-vault-still-working.png

Date/time: 2026-05-29 07:05 AM +08:00

Shows the prototype vault route with provider capability truth and health counts.

Route/page shown: Vault still working

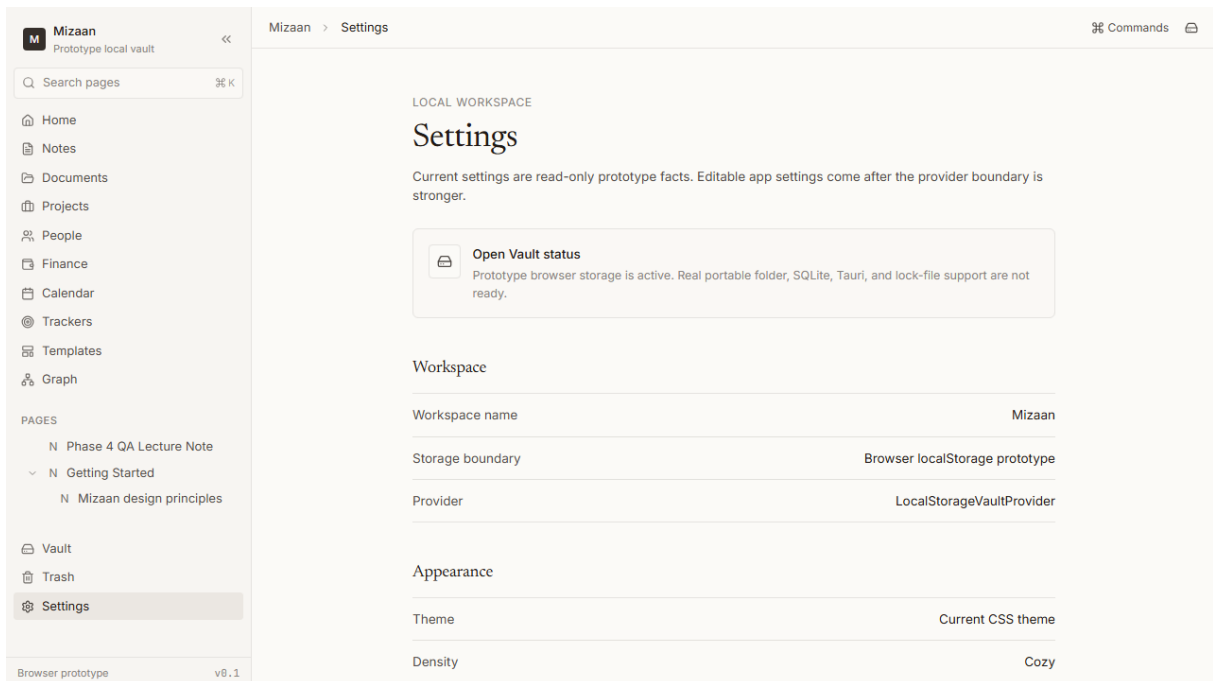

## Settings vault link

Screenshot filename: 20260529-0705-phase-4-settings-vault-link.png

Date/time: 2026-05-29 07:05 AM +08:00

Shows Settings preserving provider truth and linking to Vault.

Route/page shown: Settings vault link

## Verification Results

- npm run typecheck: exit 0.
- npm run lint: exit 0 with 6 existing Fast Refresh warnings in shared UI component files.
- npm test: exit 0; 2 files and 10 tests green.
- npm run build: exit 0; production client/server build generated with TanStack dependency warnings only.
- Browser QA: exit 0; 14 steps completed, 8 screenshots captured, zero console errors.
- git diff --check: blocked because E:\Github\Mizaan-Revamp is not a Git repository.

## Manual QA Notes

- Created a Lecture Notes page from template and opened the page workspace.
- Edited the title and first block, then refreshed and confirmed persistence.
- Opened slash command menu and inserted a Heading 2 block.
- Opened relation and outgoing right panel sections.
- Created/opened document, project, and person records.
- Opened Vault, Settings, Graph, and Trash; archived/restored an item safely.

## Honest Limitations

- No real portable folder vault exists.
- No SQLite provider exists.
- No Tauri shell exists.
- No lock file exists.
- No real filesystem backup/import/export/repair flow exists.
- No full Lexical/Tiptap editor exists.
- No full wiki-link backlink index exists.
- No full database engine exists.
- No full manual graph/canvas exists.
- CodeRabbit and local commit are blocked because this folder has no Git metadata.

## DOCX Render QA

Packaged render\_docx.py could not create PNG page renders because LibreOffice/soffice was not found on this machine. Word COM exported a PDF to docs/work-log-render/Mizaan Work Log.pdf, and structural DOCX inspection found 8 embedded screenshots, 1 function-change table, and 17 headings.

## Final Search and Marker Scan Notes

- Cloud/auth search: reviewed. Hits are product-law forbidden language, icon names, class-variance-authority, and local-first warnings; no cloud/auth/Google implementation was added.
- localStorage search: reviewed. Hits are limited to provider/session code and truthful prototype UI copy.
- Fake readiness search: no matches for portable vault ready, SQLite ready, Tauri ready, folder picker ready, or USB vault ready claims.

- Forbidden marker scan: implementation tracker and Phase 1 audit had no matches. The master plan scan still matches product-law words such as passport, password, passphrase, failed, done, and failure-state sections.
- CodeRabbit and commit: blocked because this working folder has no Git metadata.
